The Evolution of Money in 50 Years

What is Blockchain?

Blockchain technology operates independently of third-party management agencies or external hardware facilities, with no central authority controlling it. Instead, through distributed accounting and storage, each node is responsible for verifying, transmitting, and managing information autonomously. Decentralization stands as the most prominent and defining feature of blockchain technology.

Features of Blockchain

**Blockchain
is the new
financial
revolution**

Distributed Leader

Blockchain is a system for recording information in a way that makes it extremely difficult or nearly impossible to alter, hack, or manipulate.

Essentially, it functions as a digital ledger of transactions, which is duplicated and distributed across the entire network of computer systems within the blockchain

Crypto currency

A cryptocurrency is a digital currency or asset that serves as an alternative form of payment, created using encryption algorithms.

Transactions are verified, and records are maintained by a decentralized system using cryptography, rather than relying on a central authority.

Cryptocurrencies are used both as investment assets and for online purchases

DApps & Wallets

Decentralized applications (DApps) are digital apps that operate on a blockchain network of multiple computers, rather than depending on a single server.

Because they are decentralized, DApps are free from the control or interference of any single authority.

The DApps Wallet's built-in DApp browser offers a straightforward API, enabling developers to create multi-chain applications with ease

What is Smart Contract?

Smart contracts are programs stored on a blockchain that automatically execute when predetermined conditions are met. They are commonly used to automate agreements, ensuring that all participants are immediately certain of the outcome without the need for intermediaries or delays.

Metabolt Smart Contract Program

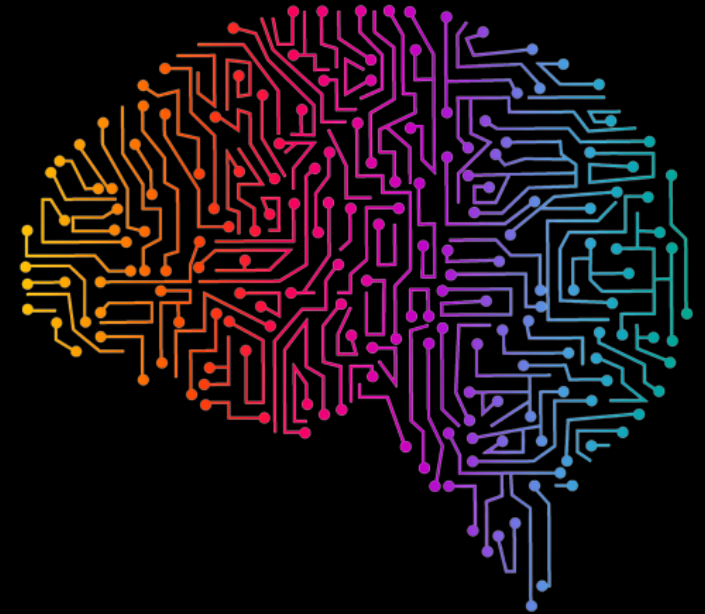

Metabolt smart contract, like any traditional contract, sets the terms of an agreement. Metabolt Crowdfunding operates as a fully **decentralized, zero-balance, open, and transparent contract, offering a fair and equitable system for global participation.**

It is governed by the strictest controls, reinforced by rigorous mathematical model deductions to ensure security and fairness. **No one, not even the developer, can modify or alter any data or transactions. The developer is also unable to withdraw funds or make any changes to your smart contract.**

Metabolt Mechanism

The Metabolt Crowdfunding model combines financial distribution, an earnings marketing mechanism, fund insurance, and blockchain technology, all committed to building the world's first blockchain-based decentralized automated crowdfunding earning program.

This innovative mathematical approach offers participants worldwide the potential for substantial benefits, without the risk of losing their hard-earned money. It presents an excellent opportunity to achieve financial freedom together. The future has arrived, and we look forward to embarking on this journey with you.

Advantage of Metabolt

No Central Authority “100% Decentralized”

No Admin Needed

The program operates entirely on 100% public blockchain technology, ensuring full decentralization. Everything is managed autonomously by a self-operating code algorithm, eliminating the need for any third-party interactions.

100% Safe & Secure

Blockchain technology is highly safe and secure, designed so that no one can alter the algorithm or remove members. The system functions independently of a website, which is only needed for the convenient display of statistics

Zero Balance Contract

All funds are distributed instantly through a zero-balance contract, with no verification requirements. The code is not open-source preventing anyone from copying or replicating the contract for use in this segment

Pay-out from Smart-Contract

This concept is designed to connect your wallet directly to the smart contract, ensuring that all transactions are 100% executed from the contract address to participants' wallets. The wallets remain completely anonymous.
